# MMIO

Memory Mapped Input Output

# 8 bit processor

a simple 8 bit processor with a text display

## A real MCU

Memory map diagram for the STM32F769I-DT. The diagram shows a vertical stack of memory blocks from 0x0000 0000 to 0xFFFF FFFF. The blocks are: CODE (0x0000 0000 - 0x2000 0000), SRAM (0x2000 0000 - 0x4000 0000), and a large reserved area (0x4000 0000 - 0xFFFF FFFF). The reserved area is divided into several sections: 0x4000 0000 - 0x4001 0000 (APB1), 0x4001 0000 - 0x4001 8000 (reserved), 0x4001 8000 - 0x4002 0000 (APB2), 0x4002 0000 - 0x4002 63FF (reserved), 0x4002 63FF - 0x5000 0000 (AHB), 0x5000 0000 - 0x5000 1FFF (reserved), and 0x5000 1FFF - 0xFFFF FFFF (IOPORT). A detailed view of the reserved area shows: Option bytes (0x1FFF FFFF), System memory (0x0800 0000 - 0x1FFF FFFF), reserved (0x1000 0000 - 0x1FFF FFFF), Flash system memory (0x1000 0000 - 0x1000 0000), reserved (0x1000 0000 - 0x1000 0000), and Flash, system memory or SRAM, depending on BOOT configuration (0x1000 0000 - 0x1000 0000).

# System Control Registers

@0xe000\_0000

Compute the actual address

- $0xe000\_0000 + \text{Offset}$

Examples:

- SYST\_CSR: **0xe000\_e010** ( $0xe000\_0000 + 0xe010$ )
- CPUID: **0xe000\_ed00** ( $0xe000\_0000 + 0xed00$ )

```
1  const SYS_CTRL: usize = 0xe000_0000;  
2  const CPUID: usize = 0xed00;  
3  
4  let cpuid_reg = (SYS_CTRL + CPUID) as *const u32;  
5  let cpuid_value = unsafe { *cpuid_reg };
```

⚠ Compilers optimize code and processors use cache!

Offset	Name	Info
0xe010	<a href="#">SYST_CSR</a>	SysTick Control and Status Register
0xe014	<a href="#">SYST_RVR</a>	SysTick Reload Value Register

0xed14	<a href="#">CCR</a>	Configuration and Control Register

# Compiler Optimization

compilers optimize code

Write bytes to the `UART` (serial port) data register

```
1  const UART_TX: *const u8 = 0x400_3400;
2  for b in b"Hello, World".iter() {
3      unsafe { UART_TX.write(*b); }
4  }
```

1. The compiler does not know that `UART_TX` is a register and uses it as a memory address.
2. Writing several values to the same memory address will result in having the last value stored at that address.
3. The compiler optimizes the code write the value

```
1  const UART_TX: *const u8 = 0x400_3400;
2  unsafe { UART_TX.write(b'd'); }
```

.

# No Compiler Optimization

CPUID: `0xe000_ed00` (`0xe000_0000 + 0xed00`)

```
1 use core::ptr::read_volatile;
2
3 const SYS_CTRL: usize = 0xe000_0000;
4 const CPUID: usize = 0xed00;
5
6 let cpuid_reg = (SYS_CTRL + CPUID) as *const u32;
7 unsafe {
8     read_volatile(cpuid_reg) // avoid cache
9 }
```

`read_volatile`,  
`write_volatile`

**no compiler  
optimization**

`read`, `write`, `*p`

**use compiler  
optimization**

# 8 bit processor

with cache

# No Cache or Flush Cache

- Cache types:
  - *write-through* - data is written to the cache and to the main memory (bus)
  - *write-back* - data is written to the cache and later to the main memory (bus)
- few Cortex-M MCUs have cache
- the Memory Mapped I/O region is set as *nocache*
- for chips that use cache
  - *nocache* regions have to be set manually (if MCU knows)
  - or, the cache has to be flushed before a `volatile_read` and after a `volatile_write`
  - beware DMA controllers that can't see the cache contents

# Read the CPUID

About the MCU

```
1  use core::ptr::read_volatile;
2
3  const SYS_CTRL: usize = 0xe000_0000;
4  const CPUID: usize = 0xed00;
5
6  let cpuid_reg = (SYS_CTRL + CPUID) as *const u32;
7  let cpuid_value = unsafe {
8      read_volatile(cpuid_reg)
9  };
10
11 // shift right 24 bits and keep only the last 8 bits
12 let variant = (cpuid_value >> 24) & 0b1111_1111;
13
14 // shift right 16 bits and keep only the last 4 bits
15 let architecture = (cpuid_value >> 16) & 0b1111;
16
17 // shift right 4 bits and keep only the last 12 bits
18 let part_no = (cpuid_value >> 4) & 0b11_1111_1111;
19
20 // shift right 0 bits and keep only the last 4 bits
21 let revision = (cpuid_value >> 0) & 0b1111;
```

## CPUID Register

# AIRCR

Application Interrupt and Reset Control Register

```
1 use core::ptr::read_volatile;
2 use core::ptr::write_volatile;
3
4 const SYS_CTRL: usize = 0xe000_0000;
5 const AIRCR: usize = 0xed0c;
6
7 const VECTKEY: u32 = 16;
8 const SYSRESETREQ: u32 = 2;
9
10 let aircr_register = (SYS_CTRL + AIRCR) as *mut u32;
11 let mut aircr_value = unsafe {
12     read_volatile(aircr_register)
13 };
14
15 aircr_value = aircr_value & ~(0x1111 << VECTKEY);
16 aircr_value = aircr_value | (0x05fa << VECTKEY);
17 aircr_value = aircr_value | (1 << SYSRESETREQ);
18
19 unsafe {
20     write_volatile(aircr_register, aircr_value);
21 }
```

# AIRCR Register

Offset: 0xed0c

Bits	Name	Description	Type	Reset
31:16	VECTKEY	Register key: Reads as Unknown On writes, write 0x05FA to VECTKEY, otherwise the write is ignored.	RW	0x0000
15	ENDIANESS	Data endianness implemented: 0 = Little-endian.	RO	0x0
14:3	Reserved.	-	-	-

Bits	Name	Description	Type	Reset
2	SYSRESETREQ	Writing 1 to this bit causes the SYSRESETREQ signal to the outer system to be asserted to request a reset. The intention is to force a large system reset of all major components except for debug. The C_HALT bit in the DHCSR is cleared as a result of the system reset requested. The debugger does not lose contact with the device.	RW	0x0
1	VECTCLRACTIVE	Clears all active state information for fixed and configurable exceptions. This bit: is self-clearing, can only be set by the DAP when the core is halted. When set: clears all active exception status of the processor, forces a return to Thread mode, forces an IPSR of 0. A debugger must re-initialize the stack.	RW	0x0
0	Reserved.	-	-	-

# Read and Write

they do stuff

- Read
  - reads the value of a register
  - might ask the peripheral to do something
- Write
  - writes the value to a register
  - might ask the peripheral to do something
    - SYSRESETREQ

# Bitwise Ops

How to set and clear bits

# Set bit

set the 1 on position bit of register

```
1 fn set_bit(register: usize, bit: u8) -> usize {
2     // assume register is 0b1000, bit is 2
3     // 1 << 2 is 0b0100
4     // 0b1000 | 0b0100 is 0b1100
5     register | 1 << bit
6 }
```

## Set multiple bits

```
1 fn set_bits(register: usize, bits: usize) -> usize {
2     // assume register is 0b1000, bits is 0b0111
3     // 0b1000 | 0b0111 is 0b1111
4     register | bits
5 }
```

# Clear bit

set the 0 on position bit of register

```
1 fn clear_bit(register: usize, bit: u8) -> usize {
2     // assume register is 0b1100, bit is 2
3     // 1 << 2 is 0b0100
4     // !(1 << 3) is 0b1011
5     // 0b1100 & 0b1011 is 0b1000
6     register & !(1 << bit)
7 }
```

## Clear multiple bits

```
1 fn clear_bits(register: usize, bits: usize) -> usize {
2     // assume register is 0b1111, bits is 0b0111
3     // !bits = 0b1000
4     // 0b1111 & 0b1000 is 0b1000
5     register & !bits
6 }
```

# Flip bit

flip the bit on position `bit` of `register`

```
1  fn flip_bit(register: usize, bit: u8) -> usize {
2      // assume register is 0b1000, bit is 2
3      // 1 << 2 is 0b0100
4      // 0b1100 ^ 0b0100 is 0b1000
5      register ^ 1 << bit
6  }
```

## Flip multiple bits

```
1  fn flip_bits(register: usize, bits: usize) -> usize {
2      // assume register is 0b1000, bits is 0b0111
3      // 0b1000 ^ 0b0111 is 0b1111
4      register ^ bits
5  }
```

**IO Bank (GPIO):** Use the correct MUX function (F5)

**SIO:** Set the pin as Input or Output

# SIO Registers

The SIO registers start at a base address of `0xd0000000` (defined as `SIO_BASE` in SDK).

Offset	Name	Info
0x000	<a href="#">CPUID</a>	Processor core identifier
0x004	<a href="#">GPIO_IN</a>	Input value for GPIO pins
0x008	<a href="#">GPIO_HI_IN</a>	Input value for QSPI pins
0x010	<a href="#">GPIO_OUT</a>	GPIO output value
0x014	<a href="#">GPIO_OUT_SET</a>	GPIO output value set
0x018	<a href="#">GPIO_OUT_CLR</a>	GPIO output value clear
0x01c	<a href="#">GPIO_OUT_XOR</a>	GPIO output value XOR
0x020	<a href="#">GPIO_OE</a>	GPIO output enable
0x024	<a href="#">GPIO_OE_SET</a>	GPIO output enable set
0x028	<a href="#">GPIO_OE_CLR</a>	GPIO output enable clear

- Input
  - set GPIO\_OE bit x to 0
  - read GPIO\_IN bit x
- Output
  - set GPIO\_OE bit x to 1
  - write GPIO\_OUT bit x

## GPIO\_OE

Bits	Description	Type	Reset
31:30	Reserved.	-	-
29:0	Set output enable (1/0 → output/input) for GPIO0...29. Reading back gives the last value written. If core 0 and core 1 both write to GPIO_OE simultaneously (or to a SET/CLR/XOR alias), the result is as though the write from core 0 took place first, and the write from core 1 was then applied to that intermediate result.	RW	0x00000000

## GPIO\_IN

Bits	Description	Type	Reset
31:30	Reserved.	-	-
29:0	Input value for GPIO0...29	RO	0x00000000

## GPIO\_OUT

Bits	Description	Type	Reset
31:30	Reserved.	-	-
29:0	Set output level (1/0 → high/low) for GPIO0...29. Reading back gives the last value written, NOT the input value from the pins. If core 0 and core 1 both write to GPIO_OUT simultaneously (or to a SET/CLR/XOR alias), the result is as though the write from core 0 took place first, and the write from core 1 was then applied to that intermediate result.	RW	0x00000000

# SIO Input

The SIO registers start at a base address of `0xd0000000` (defined as `SIO_BASE` in SDK).

Offset	Name	Info

8     // set bit `pin` of `GPIO_OE` to 0 (input)
9     write_volatile(GPIO_OE_CLR, 1 << pin);
10    read_volatile(GPIO_IN) >> pin & 0b1
11 };
```

# SIO Output

The SIO registers start at a base address of `0xd0000000` (defined as `SIO_BASE` in SDK).

Offset	Name	Info
0x000	<a href="#">CPUID</a>	Processor core identifier
0x004	<a href="#">GPIO_IN</a>	Input value for GPIO pins
0x008	<a href="#">GPIO_HI_IN</a>	Input value for QSPI pins
0x010	<a href="#">GPIO_OUT</a>	GPIO output value
0x014	<a href="#">GPIO_OUT_SET</a>	GPIO output value set
0x018	<a href="#">GPIO_OUT_CLR</a>	GPIO output value clear
0x01c	<a href="#">GPIO_OUT_XOR</a>	GPIO output value XOR
0x020	<a href="#">GPIO_OE</a>	GPIO output enable
0x024	<a href="#">GPIO_OE_SET</a>	GPIO output enable set
0x028	<a href="#">GPIO_OE_CLR</a>	GPIO output enable clear

## GPIO\_OE\_CLR

Bits	Description	Type	Reset
31:30	Reserved.	-	-
29:0	Perform an atomic bit-clear on GPIO_OE, i.e. <code>GPIO_OE &amp;= ~wdata</code>	WO	0x00000000

## GPIO\_OUT

Bits	Description	Type	Reset
31:30	Reserved.	-	-
29:0	Set output level (1/0 → high/low) for GPIO0...29. Reading back gives the last value written, NOT the input value from the pins. If core 0 and core 1 both write to GPIO_OUT simultaneously (or to a SET/CLR/XOR alias), the result is as though the write from core 0 took place first, and the write from core 1 was then applied to that intermediate result.	RW	0x00000000

```
1 use core::ptr::read_volatile;
2 use core::ptr::write_volatile;
3
4 const GPIO_OE_SET: *mut u32 = 0xd000_0024 as *mut u32;
5 const GPIO_OUT: *mut u32 = 0xd000_0010 as *mut u32;
6
7 unsafe {
8     // set bit `pin` of GPIO_OE to 1 (output)
9     write_volatile(GPIO_OE_SET, 1 << pin);
10    // write_volatile(GPIO_OUT, (value & 0b1) << pin);
11    let gpio_out = read_volatile(GPIO_OUT);
12    gpio_out = gpio_out | (value & 0b1) << pin;
13    write_volatile(GPIO_OUT, gpio_out);
14 }
```

# SIO Output

efficient

# Input

read the value from pin  $x$

- set the FUNCSEL field of GPIOx\_CTRL to 5
- set the GPIO\_OE\_CLR bit  $x$  to 1
- read the GPIO\_IN bit  $x$
- *adjust the GPIOx fields to set the pull up/down resistor*

# Output

write a value to pin  $x$

- set the FUNCSEL field of GPIOx\_CTRL to 5
- set the GPIO\_OE\_SET bit  $x$  to 1
- if the value
  - is 0 ,set the GPIO\_OUT\_CLR bit  $x$  to 1
  - is 1 ,set the GPIO\_OUT\_SET bit  $x$  to 1
- *adjust the GPIOx fields to set the output current*

# Rust Embedded HAL

The Rust API for embedded systems

# The Rust Embedded Stack

Framework	Tasks, Memory Management, Network etc. <code>embassy-rs</code> , <code>rtic</code>
BSC	Board Support Crate <code>embassy-rp</code> , <code>rp-pico</code>
<i>HAL Implementation</i>	Uses the PAC and exports a standard HAL towards the upper levels <code>embassy-rp</code>
PAC	Accesses registers, usually created automatically from SVD files - <code>rp2040_pac</code> , <code>rp-pac</code>

# GPIO HAL

A set of standard traits

All devices should implement these traits for GPIO.

```
1 pub enum PinState {  
2     Low,  
3     High,  
4 }
```

## Input

```
pub trait InputPin: ErrorType {  
    // Required methods  
    fn is_high(&mut self) -> Result<bool, Self::Error>;  
    fn is_low(&mut self) -> Result<bool, Self::Error>;  
}
```

## Output

```
pub trait OutputPin: ErrorType {  
    // Required methods  
    fn set_low(&mut self) -> Result<(), Self::Error>;  
    fn set_high(&mut self) -> Result<(), Self::Error>;  
  
    // Provided method  
    fn set_state(&mut self, state: PinState) -> Result<(), Self::Error>;  
}
```

# Bare metal

This is how a Rust application would look like

```
1  #![no_std]
2  #![no_main]
3
4  use cortex_m_rt::entry;
5
6  #[entry]
7  fn main() -> ! {
8      // your code goes here
9
10     loop { }
11 }
12
13 #[panic_handler]
14 pub fn panic(_info: &PanicInfo) -> ! {
15     loop { }
16 }
```

## Rules

1. never exit the `main` function
2. add a panic handler that does not exit

# Bare metal without PAC & HAL

This is how a Rust application would look like

```
1  #![no_std]
2  #![no_main]
3
4  use core::ptr::{read_volatile, write_volatile};
5  use cortex_m_rt::entry;
6
7  const GPIOX_CTRL: u32 = 0x4001_4004;
8  const GPIO_OE_SET: *mut u32 = 0xd000_0024 as *mut u32;
9  const GPIO_OUT_SET: *mut u32 = 0xd000_0014 as *mut u32;
10 const GPIO_OUT_CLR: *mut u32 = 0xd000_0018 as *mut u32;
11
12 #[panic_handler]
13 pub fn panic(_info: &PanicInfo) -> ! {
14     loop { }
15 }
```

```
18  #[entry]
19  fn main() -> ! {
20     let gpio_ctrl = GPIOX_CTRL + 8 * pin as *mut u32;
21     unsafe {
22         write_volatile(gpio_ctrl, 5);
23         write_volatile(GPIO_OE_SET, 1 << pin);
24         let reg = match value {
25             0 => GPIO_OUT_CLR,
26             _ => GPIO_OUT_SET
27         };
28         write_volatile(reg, 1 << pin);
29     };
30
31     loop { }
32 }
```

# embassy-rs

Embedded Asynchronous

# embassy-rs

- framework
- uses the rust-embedded-hal
- Features
  - Real-time
  - Low power
  - Networking
  - Bluetooth
  - USB
  - Bootloader and DFU

# GPIO Input

```
1  #![no_std]
2  #![no_main]
3
4  use embassy_executor::Spawner;
5  use embassy_rp::gpio;
6  use gpio::{Input, Pull};
7
8  #[embassy_executor::main]
9  async fn main(_spawner: Spawner) {
10     let p = embassy_rp::init(Default::default());
11     let pin = Input::new(p.PIN_3, Pull::Up);
12
13     if pin.is_high() {
14
15     } else {
16
17     }
18 }
```

The `main` function is called by the embassy-rs framework, so it can exit.

# GPIO Output

```
1  #![no_std]
2  #![no_main]
3
4  use embassy_executor::Spawner;
5  use embassy_rp::gpio;
6  use gpio::{Level, Output};
7
8  #[embassy_executor::main]
9  async fn main(_spawner: Spawner) {
10     let p = embassy_rp::init(Default::default());
11     let mut pin = Output::new(p.PIN_2, Level::Low);
12
13     pin.set_high();
14 }
```

The `main` function is called by the embassy-rs framework, so it can exit.

# Conclusion

we discussed about

- Memory Mapped IO
- RP2040 GPIO
  - Single Cycle IO
  - IO Bank
  - Pad
- The Rust embedded standard stack
- Bare metal Rust
- The embassy-rs framework
